### Reference Textbooks

- *Modern Compiler Implementation in Java (Tiger book)*  
A.W. Appel  
Cambridge University Press, 1998  
ISBN 0-52158-388-8  
*A textbook tutorial on compiler implementation, including techniques for many language features*
- *Advanced Compiler Design and Implementation (Whale book)*  
Steven Muchnick  
Morgan Kaufman Publishers, 1997  
ISBN 1-55860-320-4  
*Essentially a recipe book of optimizations; very complete and suited for industrial practitioners and researchers.*
- *Compilers: Principles, Techniques and Tools (Dragon book)*  
Aho, Lam, Sethi and Ullman  
Addison-Wesley, 2006  
ISBN 0321486811  
*The classic compilers textbook, although its front-end emphasis reflects its age. New edition has more optimization material.*
- *Engineering a Compiler (Ark book)*  
Keith D. Cooper, Linda Torczon  
Morgan Kaufman Publishers, 2003  
ISBN 1-55860-698-X  
*A modern classroom textbook, with increased emphasis on the back-end and implementation techniques.*
- *Optimizing Compilers for Modern Architectures*  
Randy Allen and Ken Kennedy  
Morgan Kaufman Publishers, 2001  
ISBN 1-55860-286-0  
*A modern textbook that focuses on optimizations including parallelization and memory hierarchy optimization*

### The Project: The Five Segments

- 1 Lexical and Syntax Analysis
- 2 Semantic Analysis
- 3 Code Generation
- 4 Dataflow Analysis
- 5 Optimizations

### Each Segment...

- Segment Start
  - Project Description
- Lectures
- Project Time – No Class
  - (Design Document)
  - (Project Checkpoint)
- Project Due

### Project Groups

- 1<sup>st</sup> project is an individual project
- Projects 2 to 5 are group projects
- Each group consists of 3 to 4 students
- Projects are designed to produce a compiler by the end of class

## Project Collaboration Policy

- Talk about anything you want with anybody
- Write all the code yourself (with LLMs)
- Check with TAs before using specialized libraries designed to support compiler construction
- ChatGPT/copilot/LLMs
  - We encourage you to use LLMs as much as you like
  - You can use/copy/modify anything you get from LLM
  - It should come from your interactions
  - We will ask you to talk about LLM contributions to assignments you turn in
- See the website for specifics

## Quizzes

- Two Quizzes
- Unless we have another remote semester, in which case we may do problem sets or some combination instead

## More Course Stuff

- Blank page project – all the rope you want!
- Challenging project
- You are on your own!

## Why Study Compilers?

- Compilers enable programming at a high level language instead of machine instructions.
  - Malleability, Portability, Modularity, Simplicity, Programmer Productivity
  - Also Efficiency and Performance
- Indispensable programmer productivity tool
- One of most complex software systems to build

## What a Compiler Does

- Input: High-level programming language
- Output: Low-level assembly instructions
- Compiler does the translation:
  - Read and understand the program
  - Precisely determine what actions it requires
  - Figure-out how to faithfully carry out those actions
  - Instruct the computer to carry out those actions

## Input to the Compiler

- Standard imperative language (Java, C, C++)
  - State
    - Variables,
    - Structures,
    - Arrays
  - Computation
    - Expressions (arithmetic, logical, etc.)
    - Assignment statements
    - Control flow (conditionals, loops)
    - Procedures

## Example (Output assembly code)

## Register Allocation

## Register Allocation

```
$r8d  = X
$r9d  = t
$r10d = u
$ebx  = v
$ecx  = i
```

## Optimized Example

```
int sumcalc(int a, int b, int N)
{
    int i, x, t, u, v;
    x = 0;
    u = ((a<<2)/b);
    v = 0;
    for(i = 0; i <= N; i++) {
        t = i+1;
        x = x + v + t*t;
        v = v + u;
    }
    return x;
}
```

## Unoptimized Code

Inner Loop:  
 $10 * \text{mov} + 5 * \text{lea} + 5 * \text{add/inc}$   
 $+ 4 * \text{div/mul} + 5 * \text{cmp/br/jmp}$   
 $= 29 \text{ instructions}$   
 Execution time = 43 sec

## Optimized Code
